

Abstract of the Invention

The present invention is a game machine comprising a playing field having an upper interior edge and a lower interior edge with at least one drop zone deflector located adjacent to the upper interior edge of the playing field. The present invention also has a number of exit positions located along the lower interior edge of the playing field. A payline display and a payline symbol selector display are also part of the present invention. Balls passing through the exit positions select symbols for display in the payline display determined in part upon the movement of a ball on said playing field. The game also has a ball ejector capable of propelling a ball in a path that intersects the drop zone deflector.
